NEW AND UNRECORDED OPPIOID MITES (ACARI: ORIBATIDA) FROM YOZGAT PINE GROVE NATIONAL PARK, TURKEY

BY A. TOLUK & N. AYYILDIZ

(Accepted August 2008)

SUMMARY: Ten oppioid mites are reported from the Yozgat Pine Grove National Park of Turkey including two new species. These are Ramusella (Insculp- toppia) salmani n. sp., Oxyoppia (Dzarogneta) baranae n. sp., Berniniella (Berniniella) serratirostris hauseri, Moritzoppia (Moritzoppia) escotata esco- tata, Moritzoppia (Moritzoppia) problematica, Microoppia arcuata, Moritzoppia (Moritzoppia) keilbachi, Rhinoppia trilobata and Ramusella (Ramusella) sengbuschi sengbuschi of the family Oppiidae and Autogneta (Autogneta) parva of the family Autognetidae. Habitat and distribution for each species are given. Oppioid mites were collected from soil and litter under pine forest (Pinus nigra J. F. Arnold subsp. pallasiana (Lamb.) Holmboe), lichen and moss using Berlese funnels.

INTRODUCTION

The superfamily Oppioidea comprises 1100 species, 158 genera and 40 subgenera in 12 families (Subias, 2007). They are worldwide in distribution, abundant in most of the geographical regions. Oppioid mites are most abundantly represented by species and individuals. They occur in almost all terrestrial habitats, especially in soil and litter.

In Turkey, research on the oppioid mites has also increased. To date, 23 species belonging to 5 families viz. Autognetidae Grandjean, 1960, Epimerellidae Ayyildiz and Luxton, 1989, Machuellidae Balogh, 1983, Quadroppiidae Balogh, 1983, Oppiidae Sel- nick, 1937 have been recorded from Turkey (ÖZKAN et al., 1994; ERMAN et al., 2007). The number of recorded oppioid mites from Turkey has risen from 23 to 33 by this study. This paper reports on mites of the superfamily Oppioidea, collected from Yozgat Pine Grove National Park in Turkey. Ten species are reported herein, eight of which are new records, two as a new species.

MATERIALS AND METHODS

Soil, litter, lichen and moss samples taken from Yozgat Pine Grove National Park (YÇMP) were brought to the laboratory in nylon bags. Mites were extracted from these samples using Berlese funnels and stored in 70% ethanol for microscopic study. They were cleared in 35% lactic acid and mounted on microscopic slides in modified HOYER's medium. Drawings were made using a camera lucida attached to a compound microscope. Specimens for scanning electron microscopy were cleaned in Terg-a-zyme solution for 12 h, followed by brief (1-2 s) submer- sion in an ultrasonic bath. Specimens mounted on

Fig. 3: Ramusella (Inscolptoppia) salmani n. sp. A. — Leg I; B. — Leg II (scale bar for all figures = 40)

Fig. 4: Ramusella (Inscolptoppia) salmani n. sp. A. — Leg III; B. — Leg IV (scale bar for all figures = 40)
Al-stubs with double-sided sticky tape, and gold-coated. Terminology follows Grandjean (see Travé and Vachon, 1975), Balogh (1983) and Subias and Balogh (1989). All measurements are given in micrometers (μm). The type materials are deposited in the Acarological Collection of the Zoological Museum, Erciyes University, Kayseri, Turkey.

Superfamily Oppioidea Sellnick, 1937
Family Oppiidae Sellnick, 1937

**Ramusella (Insculptoppia) salmani** n. sp. (Figs. 1-4)

**Diagnosis** — Rostral setae arched; lamellar setae smooth; lamellar lines extend as evident near the lamellar setae, then faint to translamellar line; translamellar line faint; sensilli bilaterally ciliate; the setae lm arise before the setae la.

**Prodorsum** (Figs. 1A, 2) — Rostrum rounded. Rostral setae ciliated arched inward, 16 in length. Lamellar setae smooth, 10 in length and situated closer to interlamellar setae than to rostral setae. Lamellar lines extend as evident near the lamellar setae and then faint to translamellar line; translamellar line faint. Interlamellar setae minute, 2 in length. Three pairs of bright spot situated between interlamellar setae. Bothridia round with small opening. Sensilli long, fusiform-clavate; its head with long cilia and with some short cilia on the stalk.

**Notogaster** (Figs. 1A, 2A) — Oval. Ten pairs of notogastral setae smooth. The setae lm arise before the setae la.

**Ventral side** (Fig. 1B) — Epimeral borders easily visible and strongly sclerotized. Epimeral regions with internal muscle sigilla. Epimeral setal formula 3-1-3-3. Genital plates with five pairs of setae, 22 in length, 18 in width. Anal plates with two pairs of setae, 36 in length, 34 in width. Distance between genital and anal plates 48. One pair of aggenital; three pairs of adanal setae present. Lyrifissures iad situated paranal. The adanal setae are situated as follows: ad1 — postanally, ad2 — paranally, ad3 — preanally.

**Legs** — Formula of leg setation (trochanter to tarsus): I (1-5-1+1-4+2-19+1); II (1-5-1+1-4+1-13+2; III (2-3-2-3+1-13); IV (1-2-1-3+1-10). Structure and setation of legs as shown in Figs. 3 & 4.

**Etymology** — This species is named for Prof. Dr. Selahattin Salman, Entomologist and Rector, Ahi Evran University, Turkey.

**Remarks** — *Ramusella (Insculptoppia) salmani* n. sp. is close morphologically to *Ramusella (Insculptoppia) paolii* Ivan & Vasiliu, 1999. The characters differentiating these species are given in Table 1.

**Oxyoppia (Dzarogneta) haranae** n. sp. (Figs. 5-8)

**Diagnosis** — Rostral and lamellar setae ciliate; sensilli reach to the middle of the costulae; all notogastral setae sparsely barbed.
Fig. 5: Oxyoppia (Dzarogneta) baranae n. sp. A. — Dorsal view; B. — Ventral view (scale bar for all figures = 100)

Fig. 8: Oxyoppia (Dzarogneta) baranae n. sp. A. — Leg III; B. — Leg IV (scale bar for all figures = 40).
Dimensions — Body length: 328 (300-346), body width: 161 (140-170) (holotype: 346 × 168). Holotype and four paratypes were measured.

Prodorsum (Figs. 5A, 6A-D) — Rostrum rounded. Rostral setae ciliate, 34 in length. Lamellar setae ciliate, 24 in length, situated closer to interlamellar setae than to rostral setae. Interlamellar setae smooth. There are protuberance between bothridia and lamellar setae, Sensilli pectinate, with 13-14 cilia, 24 in length. Three pairs of bright spot present between the interlamellar setae.

Notogaster (Figs. 5A, 6A, E-F) — Oval, with one pair of prominent humeral processes. Ten pairs of notogastral setae sparsely barbed, mean 34 in length

Ventral side — Epimeral borders easily visible and strongly sclerotized. Epimeral regions with internal muscle sigilla. Epimeral setal formula 3-1-3-3. Genital plates with five pairs of setae, 50 in length, 54 in width. Anal plates with two pairs of setae, 28 in length, 30 in width. One pair of aggenital; three pairs of adanal setae present. Lyrifissures iad situated inverse apoanal. The adanal setae are situated as follows: ad1 — postanally, ad2 — paranally, ad3—preanally.

Legs — Formula of leg setation (trochanter to tarsus): I (1-4-2-1-3-2-1-3); II (1-4-1-1-3-11-17); III (1-3-1-3-1-10); IV (1-2-3-3-9). Structure and setation of legs as shown in Figs. 7 & 8.

Material examined — Holotype and four paratypes N 39°48.174′, E 034°48.690′, 1547 m, 05.III.2006; one paratype, soil, N 39°48.159′, E 34°48.735′, 1544 m, 12.VI.2006; one paratype, soil, N 39°48.136′, E 34°48.749′, 1570 m, 12.VI.2006.

Etymology — This species is named for Assist. Prof. Dr. Şule BARAN, Acarologist, Sakarya University, Turkey.

Remarks — Oxyoppia (Dzarogneta) baranae n. sp. is close morphologically to Oxyoppia (Dzarogneta) khosrovica (Khanbekyan & Gordeeva, 1991). The characters differentiating these species are given in Table 2.
